Search Notes

Mahmoud – Attached is an NPL Search on the above referenced case. I conducted the search as if it were a Business Methods search and searched all of the required Business Methods databases. I searched Japio and Derwent, but did not search the full text EPO and PCT patent databases. I have tagged references that I felt might be of particular interest. Please do not limit your review to just those articles, however. If you need the full text of any of the references, just let us know.

Please let me know if you have any questions or would like for me to refocus the search.

Anne

SEARCH REQUEST FORM

Scientific and Technical Information Center

Requester's Full Name: Tony Mahmoudi Examiner #: 79360 Date: 1/27/05
 Art Unit: 2165 Phone Number 30 272-4078 Serial Number: 09/723746

If more than one search is submitted, please prioritize searches in order of need.

 Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: A Method And System For Recycling Materials
 Inventors (please provide full names): Charles R. Szmanda, Peter Trefonas, III, Richard Hemond, Mark S. Thirsk, Leo L. Linehan, Anthony Zampini
 Earliest Priority Filing Date: 11/28/2000

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

System and method of re-cycling raw materials from a plurality of streams generated by waste stream providers. Waste stream monitoring module. Monitoring Production of Produced items by waste stream providers. Determination of amount of re-usable raw materials in plurality of waste streams. Waste stream provider interface and communication link. Re-usable materials Database communicating with monitoring module. Storing amount of reusable raw material. Putting up raw materials up for sale/purchase. Associating purchase price with material. User interface, enabling users to view re-usable material and access the database. Waste Purchasing module. Receive Purchase Request. Select suitable waste based on purchase request. Fulfill Purchase Request. Recovery plant recovers specified waste. Transport waste to user. Waste stream consisting of original & waste raw material.

Journal Announcement: 9805W1

Abstract: A **database** composed of listings of industrial solid **wastes** for the State of Louisiana is being developed in a cooperative project involving investigators from academia, the State, and the private sector. Historical 'generator' and 'disposer' data are being collected from the files of the Louisiana Department of Environmental Quality and transferred of incorporation into a commercially available **database** system. Among other information, these data include unique generator, **disposer**, parish, and **waste** codes; generator address and contact; **disposer** permit number; **waste quantities**; and **waste** description. The generator and **disposer** information will be tied to ground locations using available latitude and longitude data for each of the respective sites. These spatial data will be incorporated into a geographic information system (GIS) that will also include information concerning highways and waterways, municipal boundaries, etc. Once completed, this **database** system will be linked to an expert materials evaluation system that is being developed separately. The combined use of the residuals **database** and materials evaluation expert system will require that a materials properties **database** be developed to contain physical, chemical, mineralogical, and environmental data for a given residual material. Once such a material properties **database** is established for a given residual, the residual can be evaluated by the expert system to assess the potential utilization options for the residual. When completed, the system will have application for use with both industrial and municipal solid **waste**. (Author abstract)

Journal Announcement: 9607W3

Abstract: Protecting the environment from gaseous emissions leads to the formation of a considerable amount of waste. This waste may be greatly reduced by having proper on-line measurements to determine whether the level of potential waste gas is better recycled and used again within the process. Several examples of this cost saving approach will be discussed. When the gas is not at a suitable concentration to be economically recycled and has to be scrubbed, the spent scrubber material may be sold to assist in the manufacture of another product, or may itself become the raw material for production purposes. Examples of this latter approach will be discussed, but in each case rigorous control and analysis of the spent solution is vital if the required quality specification is to be met. Cases of refineries supplying wood pulp plants with 'spent caustic' for the digesters and the 'production' of building grade gypsum from the scrubbing of power plant stacks will be described. Special attention will be paid to the analytical techniques and the type of on-line analyzer used for the applications. (Author abstract) 2 Refs.

Journal Announcement: 7404

Abstract: In order to implement practical solid-waste planning and management at the regional level, data acquisition systems which are unrestricted by jurisdictional boundaries are needed. High-altitude aircraft remote sensing provides a regional working data base and information including waste distributions, waste characteristics, and

quantities . Solid- **waste** **quantities** for a given area can be estimated from high-altitude aircraft photographs providing collateral statistics such as average **amount** of **waste** generated by a **waste** source unit, e. g. , residential dwellings, commercial or industrial facilities or by population are available. Interpretation of high-altitude aircraft remote-sensing records provides essential data for solid- **waste** planners including the location of **waste disposal** sites and facilities and contributes toward selecting the most suitable disposal method or methods for a given region. 5 refs.

Abstract: With the diffusion in progress of ISO 14001 that governs international environmental standards, environmental management has become an important managerial project, and the burden is growing heavier on the shoulders of responsible persons. Among Hitachi, Ltd., offices, an environmental management assistance tool EcoAssist is in service on the in-house computer **network** , with which employees can input their data and read documents at their personal computer terminals. Since the corporation began offering information to the outside, more than 100 contracts have been signed in a year, and the service has come to constitute a primary system in the scene of ISO 14001 certificate **acquisition** and maintenance. As for the handling of **waste** materials, it is so managed that records will be kept in storage covering their release, transportation, and disposal, although some handwork is necessary. Efforts are also being made to construct an information system, in which activities will be closely coordinated on a **network** throughout the stages of designing, manufacturing, utilization, and **waste disposal** , and a **total** system for environmental management. Some of the required functions have already been developed for these systems, and further endeavors are under way to complete them. 3 refs., 3 figs., 1 tab.

Abstract: The former Soviet Union has extensive defense-related nuclear production facilities that have released large **amounts** of hazardous and radioactive **waste** materials into the air, surface water, and ground water in areas surrounding the production sites. The key sites of concern are Mayak, Tomsk-7, and Krasnoyarsk-26, all located within the West Siberian Basin. The Pacific Northwest National Laboratory (PNNL), in cooperation with the Russian Ministry of Atomic Energy (Minatom), has been conducting contaminant-migration studies of Mayak, Tomsk-7, and Krasnoyarsk-26 in Western Siberia since 1993. The intent of this program is to maximize use of US and Russian site characterization, contaminant transport modeling, and remediation technology for the benefit of DOE and Minatom site-cleanup activities. Site characterization activities conducted during FY 1996 comprised evaluating the existing **database**, developing methods for synthesizing missing data, and designing an effective means of data and technology transfer. Comparison of the **database**, most of the contents of which have been **acquired** remotely with contaminant transport modeling data requirements allowed the authors to evaluate the utility of data **acquired** remotely for modeling purposes, and to identify gaps in the characterization of Russian **waste - disposal** sites. Identifying these gaps led to the second activity, which was to develop methods for synthesizing missing data from an evaluation of existing data. The authors tested these methods by evaluating geologic fracturing at the Mayak site. The third activity was the development of an effective procedure for data and technology transfer. The goal was to provide the site characterization **database** to Russian modelers in such a way that the data were easily transported, viewed, and manipulated for use in their models. This report summarizes the results of the three site characterization activities performed during FY 1996.

Abstract: Management and **disposition** of transuranic (RU) **waste** forms
necessitates determining entrained RU and associated radioactive
material **quantities** as per National RU **Waste** Characterization
Program requirements. Technical justification and demonstration of a
given NDA method used to determine RU mass and uncertainty in
accordance with program quality assurance is difficult for many **waste**
forms. Difficulties are typically founded in **waste** NDA methods that
employ standards compensation and/or employment of simplifying
assumptions on **waste** form configurations. Capability to determine and
justify RU mass and mass uncertainty can be enhanced through
integration of **waste** container data/information using expert system
and empirical data-driven techniques with conventional data
acquisition and analysis. Presented is a preliminary expert system
framework that integrates the **waste** form **data base**, algorithmic
techniques, statistical analyses, expert domain knowledge bases, and
empirical artificial intelligence modules into a cohesive system. The
framework design and bases in addition to module development activities
are discussed.

Abstract: The determination of transuranic (TRU) and associated radioactive material quantities entrained in waste forms is a necessary component of waste characterization. Measurement performance requirements are specified in the National TRU Waste Characterization Program quality assurance plan for which compliance must be demonstrated prior to the transportation and disposition of wastes. With respect to this criterion, the existing TRU nondestructive waste assay (NDA) capability is inadequate for a significant fraction of the US Department of Energy (DOE) complex waste inventory. This is a result of the general application of safeguard-type measurement and calibration schemes to waste form configurations. Incompatibilities between such measurement methods and actual waste form configurations complicate regulation. compliance demonstration processes and illustrate the need for an alternate measurement interpretation paradigm. Hence, it appears necessary to supplement or perhaps restructure the perceived solution and approach to the waste NDA problem. The first step is to understand the magnitude of the waste matrix/source attribute space associated with those waste form configurations in inventory and how this creates complexities and unknowns with respect to existing NDA methods. Once defined and/or bounded, a conceptual method must be developed that specifies the necessary tools and the framework in which the tools are used. A promising framework is a hybridized neural network structure. Discussed are some typical complications associated with conventional waste NDA techniques and how improvements can be obtained through the application of neural networks.

Title: Springfield's MRF goes on - line .

Author: Combs, Susan

Source: Waste Age v 21 n 9 Sep 1990 p 73-74, 76

Publication Year: 1990

CODEN: WAGEAE **ISSN:** 0043-1001

Language: English

Document Type: JA; (Journal Article) **Treatment:** A; (Applications)

Journal Announcement: 9110

Abstract: Resource **Recovery** Systems (RRS) in Essex, Conn., is recognized as one of the country's leading materials **recovery** firms, specializing in MRF design, construction, materials marketing, and day-to-day operations. The Springfield **Recycling** Facility in Springfield, Mass., is RRS's most technically advanced plant; it can process more than 240 tpd of old newspapers, corrugated cardboard, office paper, and magazine stock, as well as aluminum cans and colored glass. The Springfield MRF's mission is to minimize the **amount** of **waste** coming out of the plant. In conjunction with this philosophy, an off-site composting project slashes the MRF's **amount** of unsalvageable **waste** even further. Equipped with two processing lines, one dedicated to paper and the other for glass and aluminum, the facility is

Abstract: Though many aspects of hazardous **waste** managements have been well studied, not much is known about the emission of volatile organics

(VOs) into the atmosphere from these wastes. Significant amounts of volatile organic compounds (VOs) are emitted from a variety of hazardous wastes and waste streams in different industries. A prediction of the amount of volatile organic emission is important for managing these wastes. The purpose of this study was to develop and evaluate a test method to measure and regulate the amount of VOCs given off from different types of wastes. It was desirable to develop a method by which the volatile organics including the halogenated organic compounds could be recovered from the waste and the analyzed. Several candidate test methods for removal of VOCs from wastes were considered. The gravimetric purge and trap method was selected and modified. The technique involved suspending the waste in matrix containing H₂O and polyethylene glycol and purging with a flow of N₂. The evolving gases were then analyzed by on-line flamed ionization detector (FID) and electrolytic conductivity detector (EICD). The FID measured the amount of carbon expressed as mg of C₄ and the ILCD measured the amount of chlorine expressed as mg Cl. The total organic was calculated by adding the two values. Thus, this method was suitable for both hydrocarbons and halogenated organic compounds. In this study, synthetic wastes representing different types of waste matrices were evaluated. Modifications to the experimental apparatus were also made to simplify the operation.

Abstract: Lawrence Livermore National Laboratory (LLNL) is a US Department of Energy (DOE)' research and development (R D) facility operated by the University of California. The R D activities conducted at LLNL require the use of a wide variety of chemicals which are purchased in sufficient quantities to ensure that the necessary supply is on-hand to meet programmatic schedules and commitments. Purchasing control measures minimize excess inventories of unused chemicals, but small quantities of opened and unopened surplus chemicals still remain at the conclusion of research activities. Drum quantities of surplus

chemicals also can be generated if a programmatic activity is abruptly terminated because of loss of funding. A real-time system was needed to route unused surplus chemicals to new experiments and programs instead of to waste treatment and disposal facilities. Representatives from four LLNL organizations (Lasers, Defense Systems/Nuclear Design, Chemistry, and Business Services) combined their skills and ideas to develop and implement an on-line surplus chemical exchange system for use at LLNL. An electronic surplus chemical bulletin board, referred to as the LLNL Chemical Exchange Data Base, is the product of the group's efforts.

Abstract: The diversity and continually changing nature of the research and production programs at the ORR plant sites, as well as the size of the facilities and their physical separation on the ORR, lead to the buildup of surplus equipment and materials from canceled or completed projects, changes in work orders or directives, or over-procurement of particular items or materials. Many times, for lack of a means to find legitimate uses for these excess items, they have been **disposed** of as **wastes** or **sold** as salvage. Recognizing that this situation prevails at most, if not all, government facilities, Congress has enacted legislation encouraging the establishment of **waste** minimization, pollution prevention, and cost avoidance measures throughout government-owned facilities. In response to this, the Secretary of Energy has instituted a high-priority DOE initiative to develop, promote, and implement **waste** minimization and pollution prevention at government installations. One result of the increased awareness and emphasis on environmental concerns and improved resource management is the recent grassroots development of a surplus materials exchange **network** developed and operated on a voluntary basis by Environmental Protection Officers (EPOs) at the Oak Ridge installations. The EPOs are full-time or part-time staff members employed by each division to provide guidance and assistance for achieving compliance with all environmental regulatory requirements and to resolve **waste disposal** problems. The materials exchange **network**, called the SWAP SHOP, provides an EPO communications and problem-solving **network** to help eliminate unnecessary **disposal** of usable surplus **chemicals** and equipment at the Oak Ridge plant sites.

Life-Cycle Assessment (LCA) is a technical, **data - based** and holistic approach to define and subsequently reduce the environmental burdens associated with a product, process, or activity by identifying and quantifying energy and material usage and **waste** discharges, assessing the impact of those **wastes** on the environment, and evaluating and implementing opportunities to effect environmental improvements. The assessment includes the entire life-cycle of the product, process or activity encompassing extraction and processing of **raw materials**, manufacturing, transportation and distribution, use/ **reuse**, **recycling** and final **disposal**. LCA is a useful tool for evaluating the environmental consequences of a product, process, or activity, however, current applications of LCA have not been performed in consistent or easily understood ways. The EPA recognized the need to develop an LCA framework which could be used to provide consistent use across the board. Also, additional research is needed to enhance the understanding about the steps in the performance of an LCA and its appropriate usage. The paper will present the research activities of the EPA leading toward the development of an acceptable method for conducting LCA's.

Alt papierhandel im Internet

GERMANY: INTERNET TRADING OF WASTE PAPER

At the beginning of 1997, German Hamburg Trade **Net** GmbH introduced an **Internet** trading platform for **waste** paper. By mouse click, German **waste** management firms can make deals with factories in other European countries, without any intermediaries. The deal is automatically confirmed, and the **business** partner is informed via e-mail or fax. Initially also offers can be placed by phone or fax. For a monthly fee of DM 500, factories and **waste** management firms can make an unlimited number of **transactions** via **Internet**. The trading system also gives a review of the latest market situation.

ABSTRACT

PROBLEM TO BE SOLVED: To provide a system which can realize a market in which a **raw material** can be constantly supplied to manufacturers who produce **recycled** products such as **recycled** concrete, and **purchasers** can also stably **acquire recycled** products having quality and a price they want.

SOLUTION: A market comprising unspecified number of clients who want to discard construction **wastes**, **recycled** product manufacturers, and **purchasers** who want to **acquire recycled** products is formed by collecting a wide range of information using the Internet or the like. The **recycling** plan preparation system for construction **wastes** such as discarded concrete lumps for the market comprises an information database about the clients who want to discard construction **wastes**, an information database about the **recycled** product manufacturers, and an information database about the **purchasers** who want to **acquire recycled** products.

INTL CLASS: **G06F-017/60** ; B09B-005/00; B65F-005/00

ABSTRACT

PROBLEM TO BE SOLVED: To provide a **waste material recycling** method which makes **waste material recyclable** and effectively utilizes the **waste material** by displaying the **waste material disposed** of by spending processing expenses in the conventional practice as **waste material** for **selling** such as for **raw material** and a product needing repair in an intermediary site on a network such as the Internet and inviting a consumer widely.

SOLUTION: A system for performing a **waste material recycling** method generally comprises a new construction site/demolition site/plant (**waste material supply source**) 10 where **waste material** is generated, a general user/customer (**waste material consumer**) 20 needing the **waste material**, a construction company/wrecker/construction organization/ **waste material organization** (**waste material supplier**) 30 for supplying generated **waste material**, a site (**waste material intermediary site**) 40 on the Internet, which is provided on the network such as the Internet and mediates the **waste material**, a site operating company (site operator) 50 for operating the site 40 and a price settlement company (price settling means) 60 for settling the **waste material** traded with the site operating company (site operator) 50 as shown in the diagram 1.

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
US 20040181371	A1		14	G06F-011/00	

Abstract (Basic): US 20040181371 A1

NOVELTY - The system has a computer (12) with a controlling processor (14) having a build of material display (18). A manufacturing execution system (34) in communication with a material warehouse (24) controls execution of recipes that are used to make an associated product. A capacity consumption system (40) determines future processing capacity of each piece of fabrication equipment **disposed** within a wafer fabrication facility.

DETAILED DESCRIPTION - The processor **acquires** material move data from the material warehouse, and **acquires** a recipe usage number associated with the pre-defined amount of a representative material from the manufacturing execution system and the capacity consumption system. The processor calculates total material consumption of representative material within the wafer fabrication facility. An INDEPENDENT CLAIM is also included for a method using an online material consumption monitoring system for monitoring material within a wafer fabrication facility.

USE - Used for monitoring a material e.g. gas, photo resist, or slurry, within a wafer fabrication facility e.g. **chemical** -mechanical-polishing facility.

ADVANTAGE - The capacity consumption system determines future processing capacity of each piece of fabrication equipment, thus adjusting the values associated with standard amount of material consumption and the forecast amount of material consumption, to achieve better control of material consumed within the wafer fabrication facility, if the accuracy for both the standard amount of material consumption and the forecast amount of material consumption is low. Therefore, the material wastage and the **costs** associated with material **waste** are reduced.

DESCRIPTION OF DRAWING(S) - DESCRIPTION OF DRAWING - The drawing shows a block diagram overview of an online material consumption management system.

Abstract (Basic): JP 2003334530 A

NOVELTY - The waste paper material generated during paper package manufacturing process is regenerated and is utilized as the raw material for producing another package based on order from consumers.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for recycling method for waste paper material.

USE - For recycling waste paper material.

ADVANTAGE - The recycling of the waste paper material avoids disposing of the waste paper material and contributes for environmental conservation. The need for intermediate distribution traders is avoided, enabling to supply recycled article at low cost

DESCRIPTION OF DRAWING(S) - The figure shows a block diagram of the business-connections in the recycling system for waste paper material. (Drawing includes non-English language text).

Abstract (Basic): JP 2003228615 A

NOVELTY - An arithmetic unit calculates processing cost of an organic excreta ejected from an organization. An acceptance unit accepts order of chemicals during recycling of an organic excreta, and delivers the extracted chemicals obtained during recycling to respective pharmaceuticals corporation. The credit obtained by selling the recycle chemicals is subtracted from total discharge recycling cost.

DETAILED DESCRIPTION - An arithmetic unit (120) calculates processing cost of an organic excreta ejected from an organization (20). An acceptance unit (140) accepts order of chemicals during recycling of an organic excreta, and delivers the extracted chemicals obtained during recycling to respective pharmaceuticals corporation (30). The credit obtained by selling the recycle chemicals is subtracted from total discharge recycling cost.

An INDEPENDENT CLAIM is also included for organic excrete recycle network.

USE - For promoting recycle of organic excreta such as plastic waste, using electronic communication techniques.

ADVANTAGE - Enables an ejection organization to procure chemicals from chemical pharmaceuticals corporation, therefore rate of recycling organic excreta is improved.

DESCRIPTION OF DRAWING(S) - The figure shows the functional block diagram of organic excreta recycling information management system. (Drawing includes non-English language text).

Abstract (Basic): JP 2001350879 A

NOVELTY - A waste material provider registers waste material provision information in a homepage (4) of a waste -material exchange recommendation unit. A waste material utilizer browses the provision information and registers waste material requirement application. The recommendation unit recommends transaction of waste material between provider and utilizer based on registered application.

USE - For exchanging waste material of one enterprise to other enterprise which reuses waste material.

ADVANTAGE - Promotion of environmental preservation is achieved as amount reduction of waste material is achieved. Processing cost of waste material and purchasing cost of raw material is reduced as waste material is effectively recycled as a raw material .

DESCRIPTION OF DRAWING(S) - The figure shows a system block diagram of waste material exchange system. (Drawing includes non-English language text).

Abstract (Basic): WO 9318466 A

The appts. provides management procedures including form generation and compliance with reporting requirements for safe **disposal** of hazardous substances. The appts. includes six functional groupings and a database scheme (71). The six are a Hazardous Materials Index (11) which maintains a **chemical** location table for hazardous substances at a facility. Hazardous Materials Management (31) for tracking the movement and use of hazardous substances at the facility.

Human Resource Management (41) for monitoring exposure of each worker to specified hazardous substances. Hazardous Commitment Management (61) for monitoring compliance requirements. Hazardous **Waste** Management (51) for monitoring selected **waste** management and Hazardous Permit Management (21) for monitoring approvals, renewals and expirations of regulatory agency permits allowing storage, usage or emission of specified hazardous substances.

ADVANTAGE - One integrated system provides six functional groupings and relational database scheme that integrates any number of these gps. and allows them to share or exchange information on hazardous substances for in-house and regulatory compliance related functions.

WATER9, offered by the National Technical Information Service (NTIS) and the U.S. Environmental Protection Agency (EPA), estimates the air emissions of individual **waste** elements in **wastewater** collection, storage, treatment, and **disposal** facilities. The program also features a **database** that contains organic compound information. WATER9 supports the evaluation of facilities that contain multiple **wastewater** inlet streams and collection systems. It also can be used to analyze treatment configurations. Emission estimates are based on compounds' properties and on the concentration of compounds in **wastes**. The system can reference site-specific compound property information. It estimates emissions from industrial and municipal **wastewater** collection and treatment facilities.

SciQuest.com's Enterprise Reagent Manager (TM), or ERM, can be tapped in simplifying reagent management processes. A browser-based interface supports real-time access to technical and commercial reagent information. ERM users can access internal and supplier inventory **databases**. The shopping cart feature lets researchers requisition reagents from suppliers or in-house stockrooms. The product provides storefront access to

Sigma-Aldrich and other reagent suppliers. ERM supports order replenishment and back order tracking processes. The system can locate inventoried reagents by material, vendor, owner, status, or formula. It also includes barcode tracking features. ERM notifies health and safety professionals about reagents arriving at research sites. The system can be employed in tracking **waste disposal** costs and in forwarding **waste** pickup requests. ERM improves researcher productivity and simplifies resource allocations processes.

GRADE: Product Analysis, No Rating

According to Karen Welsh, CTO for WaterDesk (the **online** exchange for the **wastewater** industry), WaterDesk wants to extend the supply chain in order to better serve customers in the new economy. Application integration is an important business function for e-commerce. WaterDesk sought out Neon Software to integrate its processes with those of customers. WaterDesk, in order to succeed, has to integrate processes with those of customers, be able to see the inner workings of the supply chain, and see the entire workflow from beginning to end. WaterDesk has to know business processes, logic, and rules, including how each customer processes **purchase** orders, shipping status, or credit. Business community integration is the goal, which requires linkages at many levels, including data, process, application logic, and business rules. However, IT is only just beginning to adopt such levels of process integration, and a recent survey finds that only 28 percent of over 300 respondents can link data and applications. Only 15 percent reported a **total** inability to link to data or applications, while others could integrate either data or applications, but not both. Among a few companies that have looked at the difficulties surrounding application integration are Healthcare, which deployed enterprise application integration (EAI) from Software Technologies; Teligent, which chose products from Active Software; idvSports, which uses Mercator and XML; and Source Alliance, which chose software from CrossWorlds Software and webMethods.

National Instruments' Lookout is a **Web** -based system that simplifies the development of HMI/SCADA applications. The product supports the collection of real-time information, streamlining decision-making. It employs TCP/IP **networking** technology in providing users with browser-based remote input-output (I/O) display and control features. The system also includes data access control features. Lookout can be used to control and monitor **chemical**, petrochemical, gas pipeline, **wastewater** plant, paper mill, food processing plant, and other industrial applications. It includes OPC client and server features. It also allows users to link to Microsoft (R) Visual Basic (R), Java, Borland Delphi, C, and other programming environments. Tapping the system, users can modify applications without interrupting device communications. Lookout can connect a manufacturing execution system (MES) with enterprise resource planning (ERP) applications. It retrieves real-time or historical data. The system can poll over 50,000 I/O points. It includes X-Y motion, resizing, dynamic coloring, bitmap import, and other visualization features. The system also provides distributed logging and event notification features.

PRODUCT NAMES: Company--Verticalnet Inc (871834)

TITLE: VerticalNet Is Building B-to-B Communities With Functionality
AUTHOR: Staff
SOURCE: Upside, v124 p46(3) Aug 2000
ISSN: 1052-0341
HOMEPAGE: <http://www.upside.com>

RECORD TYPE: Review
REVIEW TYPE: Company

VerticalNet, which started out in 1995 as an **online** community for the **wastewater** treatment community, evolved into a more advanced site that could obtain advertising revenues and sales leads. Based on the success of its business model, the founders, Mike McNulty and Mike Hagan, started building storefronts for manufacturers and created what current CEO Mark Walsh calls 'A better, more functional, more actionable, real-time bingo card.' VerticalNet then obtained \$1 million in venture capital and turned loose the PollutionOnline.com and SolidWaste.com sites, and a few other verticals that also target the environmental sector. Another round of VC funding allowed VerticalNet to open its **Chemical Online** and **Food Online** vertical sites and to continue its strategy of building trade magazine-type **Web sites** with a uniform metaphor. Today VerticalNet has 56 industry-specific, **online**, business-to-business (B2B) communities grouped into 143 industry sectors; 10 were **acquired**, and all the communities emphasize community over content because 'only through community will commerce occur.' The communities do not raise the blood pressure of investors, but overall, VerticalNet is gaining a reputation as an aggressive **buyer** of companies that is expanding quickly and (since 40 percent of VerticalNet's traffic is outside the U.S.) and as a global presence.

INTELLIGEN's EnviroPro Designer (R) is an environmental process simulator that allows users to develop, evaluate, and optimize technologies. The system includes models for over 70 operations. It provides users with equipment sizing and costing, VOC emission calculation, **chemical** component fate prediction, and **waste** stream characterization features. EnviroPro Designer includes a **chemical** component and mixture **database**, as well as equipment and resource **databases**. A straightforward interface streamlines modeling. The system can export PDFs in DXF and WMF formats. It integrates with word processing, spreadsheet, and graphic design applications. EnviroPro Designer also includes **online** help features. The system offers users reaction, pressure change, drying, phase separation, and other unit procedure models. An evaluation version of the product can be downloaded from the INTELLIGEN **Web site**.

TEXT:

GOLDEN, Colo.--(BUSINESS WIRE)--June 4, 1996--In a major promotion designed to kickstart its introduction, TSD Central, the developers of a centralized collection of industrial waste service business sites on the Internet, announced the availability of its service on a no-cost basis to hazardous waste generators.

Making the announcement was Eliot Cooper, president of TSDX Corp.

"TSD Central continues to prove itself successful with owners of industrial waste disposal sites and services," said Cooper. "With over 200,000 generators, we're offering this valuable service at no charge to provide the impetus to get the word around," he added, noting the company is basically using the same model that has made other online services, such as America Online and Netscape, successful.

Perma-Fix Environmental Services Inc., an operator of five industrial waste treatment facilities, is one of many companies using the Internet service provided by TSD Central to market companies seeking industrial waste management services. "With the new market reach service provided by TSD Central we are able to deliver competitive quotations and information to industrial waste generators in a faster and more cost-effective mode than traditional methods," said Lou Centafonti, president of Perma-Fix.

TSD Central is a collective marketing and promotion firm providing a highly interactive marketplace where **buyers** and sellers of industrial **waste** services communicate and **transact business**. It handles all of the technical and financial complexities of maintaining the high speed reliability users seek on the **Internet**.

TSD Central can be located on the Internet's World Wide Web at <http://www.tsdccentral.com>.

TEXT:

A host of online services have sprung up to serve the needs of garbage haulers and recyclers.

The trash mice are here. At WasteExpo 2000, a host of online businesses announced their presence in the solid waste industry offering waste haulers, disposers, recyclers and waste generators a variety of business-to-business (B2B) services. B2B is an e-business term for on-line companies that serve businesses -- not consumers -- in one way or another.

For example, a hauler can log onto a number of online B2B services and search for commercial customers, municipal contracts, used and new equipment, and even headlines of key developments in the waste industry. Waste generators can log onto the same sites and post their needs, simply or in a formal request for proposals (REP). And recyclers and landfill operators can search services with areas devoted to equipment such as compactors.

While the services these new dot-coin companies vary many are developing software that solid waste organizations can use to improve management techniques. One company, for instance, plans to offer route optimization tools that can be used online. That means instead of buying and using expensive software, you simply subscribe to a service and use the software application that is up, running and waiting for you.

Of course, to get information, you have to give information. Recognizing users will want to ensure the confidentiality of their reporting, B2B providers are spending significant amounts of time to guarantee customer security. However, that doesn't mean all online B2B services are foolproof. You should investigate all claims carefully, researching security issues beyond what any particular provider tells you.

Despite the benefits online B2B services can provide, taking advantage of the services will require that you spend time clicking around from site to site so that you understand how each applies to your operations. You will have to force yourself to think in new and different ways about what you do and how these online services might contribute. You also will have to be patient -- many sites have yet to implement all of their ideas, so they may have glitches.

But ultimately, if you watch for progress, you will discover opportunities. The new online companies are designed to increase your revenues with new sources of business, as well as to help reduce operating costs with more efficient supply and management techniques.

Here's a look at what 10 companies have to offer in the solid waste management B2B online arena.

Analine.com

Boston

www.analine.com ne.com

Analine.com operates a reverse auction for haulers and waste generators, and provides a number of application service provider (ASP) (See "Defining Web Words" on page SS11) tools to help its users conduct business.

John McQuillan, president and CEO of Analinecom, describes the company as a commerce tool for the waste industry, the hazardous waste industry, the consulting engineering industry and environmental industries as a whole.

"According to the U.S. Department of Commerce, the environmental industry is a \$200 billion market splintered into a number of spaces," McQuillan says. "The largest of these operate in the solid waste industry. We've built out products for the solid waste industry and a number of other categories."

"Our primary focus right now is on the very large purchasers of environmental products, services and technologies," he continues. "Our exchange is just the first of a number of planned applications or Internet-based tools that will help make a buyer's life easier. In short, this is an operating system that includes all the time and money saving applications that a buyer and a seller will ever need. It includes tools for enterprise resource planning (ERP) and customer relationship management (CRM) all together in one area."

The Analine.com exchange model offers a reverse auction service that, according to McQuillan, takes advantage of the Internet's ability to "put power into the hands of buyers and enables them to apply the strengths of free market economics to individual transactions."

In a reverse auction, a buyer posts a RFP, and sellers post bids

designed to meet the REP's requirements. Unlike a regular auction, bidders are suppliers, not buyers. In contrast to a regular auction, prices ordinarily fall during bidding instead of rising. At the end, lower bids are more likely to come out on top.

Analine.com's auction area offers two kinds of reverse auctions for buyers, who can choose the one most suited to their needs. First, buyers can request value bids in which price represents only one selection criteria. The buyer sees all of the bids posted in response to the RFP, as well as basic company information included by the seller in the proposal. Second, buyers can request a low-bid auction in which price is the only consideration. Buyers will see only the lowest bid and have no opportunity to select a higher bid.

Bidders can view the amounts bid by other sellers and may lower, but not raise, their bids until the auction closes. Sellers submitting bids must accept an agreement that underscores the legal impact of the offer. Buyers selecting a response to their RFPs enter into a binding agreement to pay the bid amount.

Analine.com generates revenues by charging fees to bidders on contracts worth more than \$1,000. Additionally, Analine.com charges one-half of one percent (0.05 percent) of the total amount of the winning bid. Charges are billed to credit cards.

EWaste

Atlanta

Due on-line this summer, eWaste plans a three-phase introduction of its services to the waste management industry, according to company president Vince Bankoski.

www.ewaste.com

Phase I will introduce a portal concept aimed at creating a community of users. "We're currently working with content partners to provide news and information important to waste management professionals," Bankoski says. "Our partners in this effort include magazine publishers, research services, government agencies and people with information resources in the real world."

Plans call for the portal to generate revenues through sales of banner advertising and marked-up fees charged by information providers.

"The goal of the portal is to build our brand name," Bankoski says.

Then, Phase II will launch in the fall of 2000. This phase will introduce an auction model designed to facilitate transactions between waste generators and service-providers. Fees have not been established, but Bankoski notes that auction services generally charge fees ranging from 1 percent to 10 percent of the transaction's value.

Bankoski holds high expectations for the auction software eWaste is creating. "It's a killer application," he says. "It's a dynamic auction instead of a static one. The price moves in an automated fashion, and the buyer and seller are empowered to close at any time. In other words, you no longer have to be the low bidder. In a conventional auction, you submit your bid and cross your fingers. In a dynamic auction, the prices change in front of your eyes, and when two parties are satisfied, they close. This is a new idea."

Bankoski expects the model to attract copycats but is banking on the brand-building efforts of Phase I to position eWaste as the identifiable service.

Phase III, scheduled to arrive on the eWaste site early in 2001, will provide what Bankoski calls back-end integration. "In this area of our service, partners called application service-providers will supply tools to help our users manage their businesses online," he says. "What this means is that you may not have to hire an Internet guru. You can come here for the tools you will need to manage relationships with customers and suppliers. You won't have to buy 50 software packages, integrate them into your business and train your employees. You simply subscribe to a service that understands your business. You can customize these tools to fit your look and needs. This makes everything more affordable and easier," he claims.

Fibermarket.com

Atlanta

Fibermarket.com has created a market-maker exchange on the Internet to facilitate business relationships between buyers, sellers, brokers, dealers and intermediaries interested in fiber products.

www.fibermarket.com

"We think of our model as a fiber management marketplace," says Jeff Abbott, vice president, corporate strategy for the company. "In essence, we provide the digital tools to simplify the buying and selling of recycled fiber materials for paper mills, forest product companies, recovered fiber producers and aggregators."

Sellers include large national and small local recycling collectors, and plant operators. Buyers range from fully integrated paper companies to small independent mills.

Interested businesses may log onto the site at no charge. Users, however, must complete a profile that qualifies them as a buyer, seller or intermediary. Based on the profile, the site provides different functionalities, with screens and tools tailored to business needs.

Fibermarket.com generates revenues from fees related to transactions between buyers and sellers, as well as through value-added services, which are being added to the site and will carry what Abbott describes as a nominal fee based on the value it contributes to the transaction. For example, value-added services include transportation of the purchased materials.

Another value-added service covers transaction financing. The company plans to offer a settlement feature that will enable qualified buyers and sellers to transfer funds electronically.

More advanced services planned for the site include developing an Oracle Corp. global exchange platform. "This is an important development for us," Abbott says. "It will let us leverage Oracle's supply chain collaboration technology to enable a buyer or seller to connect their suppliers and vendors to the marketplace. For example, if I were managing a paper company and wanted to line up my manufacturing runs for the next month, I would have to evaluate the raw material inventory on one side, while simultaneously looking downstream at demand from my sales channels. With this information, I could project my production runs."

"In a traditional environment this would involve a lot of manual work. But in a collaborative online supply-chain environment with suppliers, vendors, channel partners and customers all connected, it becomes more efficient," he says.

Fibermarket.com went on-line in October 1999 financed by venture capital from investors such as Neocarta, Charthouse Group and J.P. Morgan. The company recently engaged Oracle Corp. as a technology partner and significant investor.

PaperExchange.com

Boston/London

www.paperexchange.com

PaperExchange.com offers solid waste haulers and recyclers an online market, or exchange, for a variety of recycled paper products. The company deals with all product segments of the paper industry: container board and packaging, newsprint, printing and writing paper, publishing, pulp, towel and tissue, and recovered paper.

Sellers as well as buyers may log onto the site free of charge. Sellers may post their paper offerings, and buyers may search the site by product, grade or another specific feature that they're looking for. PaperExchange provides the conduit for buyers and sellers to negotiate their own deals, and PaperExchange takes a 3 percent commission on the total national value of completed sales. The seller pays the commission.

A recent upgrade to the site offers a service called Target RFQ or Request For Quote. With this new function, buyers can submit an REQ to the service, which then will distribute it to preferred suppliers. Sellers may choose to bid on the entire RFQ or on separate items.

Additional services include credit approval, payment processing, and logistics for both buyers and sellers.

"We provide solid waste sellers the ability to play on a bigger field," says Kevin Preblud, executive director, recovered paper for PaperExchange. "We qualify buyers with a line of credit and we clear the transactions. That means the seller sells to PaperExchange and need not conduct a credit check."

How does the product move from seller to buyer? "Logistics is another component of what we offer," Preblud adds. "Suppose a seller offers product Freight On Board (FOB) delivered. In that case, the seller pays the freight charges. A seller might offer FOB origin, which means the buyer

must pick it up at the sellers door and handle the shipping."

In either case, PaperExchange will arrange for shipping if the buyer or seller requests it.

As an incentive for buyers and sellers to visit the site, PaperExchange also offer content including job listings, schedules of industry events, news headlines and a resource directory.

A number of the company's key executives have several years of experience in the paper industry. For example, President and CEO Kent Dolby comes from Andersen Consulting, where he served as global managing partner of the company's global natural resources practice, which included forest products.

PaperExchange went online two years ago in 1998. Investors include The Kraft Group, Internet Capital Group, Madison Dearborn Partners, MSD Capital L.P, Staples, International Paper, Asia Pulp & Paper, Terrapin Partners LLC, David Wetherell and Roger Stone.

The company recently filed its intention to make an initial public offering and go public.

RecycleNet Corp.

Guelph, Ontario, Canada

www.recycle.net

Founded in 1995, much earlier than most emerging waste dotcoms, RecycleNet Corp. operates an information and trading exchange for buyers and sellers of all kinds of recycled materials. "We operate a free and open trading exchange," says John Robb, sales manager for RecycleNet. "We put buyers and sellers together, but we do not stand in the middle of the transaction. A selling company might post a listing to sell so many pounds of scrap plastic on our site. The offer might be for a one-time deal or an ongoing series of transactions. A buyer using our site will see the listing and contact the company. The two parties negotiate the transaction between themselves."

Because RecycleNet does not get involved in the transaction, the site differs significantly from auction, brokerage or other sites that act as intermediaries.

The company generates revenues by selling advertising, value-added services and tools designed to make the system work more efficiently.

Robb declines to describe the value-added services or software tools in detail, saying only that the chief value-added service is a lead referral system. Software tools enable users to enhance their offerings with photographs, he says.

The key to the site, according to Robb, is the idea of creating a marketplace on the web for recyclers.

"Where do recyclers go?" he asks. "A recycling center negotiates a transaction with a seller, but how does the seller know what the prices are? Prices for recycling materials bounce around because the system is transaction-based. As a free trading system, we provide an overview of the marketplace. That's the benefit we offer."

Robb also emphasizes the need for easy use. "I see a lot of new websites with cool technology," he says. "But our users may not be able to use those sites. In many instances, there is a gap between the business concept and the technology. To be successful, you have to close that gap, making sure that what you are doing is about the business and not the technology. Recyclers, after all, don't love technology. They want to move cardboard."

WasteBid.com Inc. Fairfax, Va. www.wastebid.com

WasteBid.com comes to the Internet market as the brainchild of Gershman, Brickner and Bratton Inc., a Fairfax, Va.-based solid waste management firm. The **business** -to- **business** company aims to become an intermediary between **buyers** and sellers of solid **waste** services and new and used equipment. Site users include traditional **waste** hauling companies, **recycling** plants, **disposal** operations, equipment sellers and **waste** generators.

"Our site will stress **recycling** and will devote areas to recycled-content materials," says Robert Brickner, chief marketing officer for the company. "Most of us got into the **business** in the 1970s based on personal commitments to waste reduction and recycling. From that point of view, we want to give equal time to recycling."

When joining service-providers and waste generators together, Brickner emphasizes that his site does not function as a reverse auction or

as a waste broker.

"Our site aims to mirror the way the industry works," he says. "Service-providers register with us to offer their services. Waste generators sign up by filling in forms describing their service requirements. Then, WasteBid.com solicits bids from the registered service-providers. Whoever makes the lowest responsive bid gets the contract.

Brickner notes that the general advantages of making deals online include speed for both buyer and seller, and the elimination of sales calls for the buyer.

WasteBid.com earns money on commissions when transactions are completed on the site. Who pays the fees depends on the transaction, according to Brickner.

While Gershman, Brickner and Bratton Inc. formed WasteBid.com, Brickner says that the relationship between the two companies formally remains at arms length.

wasteclick.com

Orange, Calif.

Wasteclick.com is a vertical industry portal, or vortal, designed to provide information, products and services to the waste management industry.

www.wasteclick.com

The site, which began in spring 2000 as an extension of Trans-Comp Systems Inc., offers waste industry news, research, discussions, newsletters, online tools, searchable job listings, career aids, a number of other informational sources and electronic commerce services.

Discussion forums and e-mail will allow members to ask for information and choose products and services from the site's electronic commerce offerings, according to the company.

Wasteclick.com also hosts a number of electronic commerce businesses. Sellers operating storefronts on the site offer products such as containers, vehicles, equipment, components and supplies.

Buyers or shoppers can compare specifications and prices, place orders, make payments or establish credit, and then arrange to have the product drop-shipped.

Additionally, the site conducts auctions and reverse auctions for used and surplus equipment, commodities and recyclables.

Membership and use of the information on the site is free. The company generates revenue by charging fees to create storefronts and Internet marketing strategies for waste industry businesses.

"We're a consultant," says Patrick Sweeney, the company's general manager. "We'll show companies how to use the tools at our site to implement an Internet strategy. If you manufacture compactors, for example, you may want to market that product on the net. You can pay to do this internally or you can contract with us to create a storefront on our site."

According to wasteclick.com literature, the company also plans to offer operations management solutions to waste management organizations. With this set of tools, companies reportedly can handle tasks such as accounting, route optimization and scale-house management online, without purchasing and maintaining those software systems in-house.

TransComp Systems Inc. is a software developer and provider of professional services specializing in financial and operations management applications for the waste and recycling industries.

wastedepot.com

Columbus, Ohio

Wastedepot.com went online in April of this year as a business-to-business exchange. Founded by the Columbus, Ohio, -based The Ecology Group, wastedepot.com offers a reverse auction format focused on matching local haulers with local commercial waste generators.

www.wastedepot.com

Wastedepot.com buyers and sellers may be part of large national companies or small independent haulers or businesses. Nevertheless, the company has developed its electronic commerce model around the oft-repeated observation that the garbage business, like politics, is local.

"We're nuts and bolts guys," says Nick Nicholson, president and CEO. "We help the pizza joint with a dumpster and the grocery store with a roll-off find a company to haul their trash. Of course, the pizza restaurant might be part of a national chain, and the hauler might be a local division of a national company

Nicholson believes Wastedepot.com's results during its first quarter of operation point to the appeal of the company's business model.

"I would estimate that our service facilitated about 500 deals so far," he says. "Right now, we have about 53,000 locations that will go up for bid over the second half of 2000. These are buyers that have registered for our auction."

If Wastedepot.com continues to attract buyers at its current rate, Nicholson speculates that the company will eventually bid out 20,000 locations per month, worldwide.

To those who think that sounds wildly optimistic, Nicholson notes that it is only 10 percent of the worldwide market.

Wastedepot.com generates revenues by charging haulers a commission for contracts won in the bidding process. Haulers also pay a monthly fee of \$39.95.

"After discussing our service with a small, local hauler, that company decided to postpone hiring a sales person," Nicholson says. "Using our service, they won \$18,000 of business in 18 minutes online and decided that our commissions were cheaper than a salesperson."

Another intended benefit of the localized Waste depot.com strategy is that it aims to attract large waste generators with numerous locations.

"Suppose a very large client with many locations across the United States and Canada came to us," Nicholson says. "Our software offers a way to put up their bid locations in a batch, all at once. They transmit the data to us, and we put it up on the service. The same principle works for a small restaurant chain with five or six locations."

However, the chief benefit of the concept, as with all Internet services, appears to be speed.

"We're facilitating business transactions that might take a month to complete over the telephone and through the mail," Nicholson says. "With our service, it normally takes a week."

Looking forward, Wastedepot.com's top management plans to develop its site by adding an exchange for waste haulers offering both new and used equipment in the third quarter of this year.

Farther down the line, the company plans of other services from facilitating bill paying to cost management.

The Ecology Group is a management company. (See a related story on The Ecology Group, "Consolidations of Another Kind," beginning on page 54 in this issue.)

WoodFuel.com

Houston

www.woodfuel.com

WoodFuel.com buys and sells wood fuel online. The company also forms alliances with equipment, transportation and financing companies to enhance its services to buyers and sellers.

"We are not an exchange that simply puts buyers and sellers in contact with each other," says Scott Mactier, a partner with WoodFuel.com. We actually purchase the woodfuel material and resell that material to our customer base."

In time, Mactier expects "to be the largest gatherer of woodfuel material in the world." He adds: Providing a centralized source of information also will be an important aspect that our site provides to the industry."

Currently, the company targets woodfuel suppliers such as grinding operators, mills, municipalities, wood waste generators, public utilities, power line trimmers, landscapers, pallet distributors and solid waste collectors.

"For example, we have a contract with Novus Wood Group in Houston, one of the largest gatherers of wood material in Texas," Mactier says. "The company gathers about 500,000 tons per year, and the contract commits a large portion of the product to us."

Buyers include energy and utility companies, paper mills and saw mills. Donohue Industries Inc., Sheldon, Texas, for example, operates a newsprint and market pulp plant that has contracted to purchase approximately 250 tons of woodfuel per day from Wood Fuel.com. Donohue uses the wood as an alternative to natural gas to fire its boilers.

Mactier believes that the Wood Fuel.com premise will work by consolidating sellers.

"Buyers are usually large companies with large bulk needs. Suppliers

are many and fragmented," he says. "What makes our idea work is consolidating a source of supply for buyers. We also help to enhance the quality of the product. For example, we will meet with suppliers, analyze their operation and provide advice about how to enhance their procedures to raise the quality and value of their product."

The site also offers links to equipment manufacturers that may be important to suppliers.

As of mid-June, the WoodFuel.com website offered little in the way of information resources, but Mactier says he plans to begin centralizing a database of articles about the industry for future access.

Online since April 2000, Wood Fuel.com received its initial capital from eight private investors who have taken an active role in the business.

Wwwaste.com, Inc.

Miami

www.wwwaste.com

Wwwaste.com Inc. came online in February of this year. Developed by several executives of the Miami, Fla.-based Star Service Group and Delta Recycling, a solid waste company and a recycling company, this web-site is betting that its take on the world of electronic commerce will appeal to other solid waste haulers and recyclers.

Despite these key relationships, Wwwaste.com stands on its own as a separate company not related to Star or Delta, according to Jack Casagrande, the company's founder and vice president of the recently introduced service.

In its first few months, the wwwaste.com site primarily served as a source of information about the waste industry. It provided news, feature articles, live stock market quotes for waste companies, a chat room and bulletin boards for job listings and equipment sales.

"Another area we're currently developing will post full listings of bid opportunities as they arise for municipal, state and federal contracts," Casagrande says of the website's progress. "Our goal is for a hauler to key in a service area, say two or three county names, and be able to review bidding opportunities and get all the information necessary to develop an RFP."

Plans also call for providing hauler listings that waste generators can search.

Casagrande describes the overall business concept as a directory or information site. Revenues will come in the form of advertising or user fees yet to be firmly established. For example, "a local hauler might pay \$100 per year to be a member," Casagrande says.

"The membership fee entitles the hauler to full access to the site and an advertisement. But anyone can come to the site and purchase services. It will cost about \$10 to post a contract listing and \$10 to view a listing," he adds.

As of the time of publication, access to the site remained free for both buyers and sellers, because Wwwaste was focused on building an identity for the service.

Michael Fickes is Waste Age's business editor

Defining Web Words

ASP: An application service provider or ASP pools together a number of electronic tools to create an operational platform for interested users. Amercia Online, for example, is an ASP that provides a variety of tools, from Internet browsers to financial market tracking, for its members.

Auction: A transaction process in which sellers solicit bids from buyers, with a product or service going to the highest bidder. See Reverse Auction.

B2B: An online operation providing services that link two or more businesses.

B2C: An online concept in which a business sells products and services to consumers.

Exchange: An online service that creates a forum for exchanging information, products and services for which fees may or may not be charged. There are two primary categories of exchanges: information and market. An information exchange facilitates the free exchange of information among users and generates income from the sale of services to companies with storefronts or advertising on the site. A marketmaker exchange provides an electronic forum for doing business. A key element of a market-maker is that the exchange never takes title to a product. The

exchange occurs solely between the buyer and seller, with the market-maker possibly earning a commission.

Intermediary: A company that brings buyers and sellers together, charging fees to both sides. The concept distinguishes an intermediary from a broker, whose fee structure may imply loyalty to one or another party to a transaction. Depending on the fee structure, an intermediary and market-maker may perform similar services.

Portal: An Internet site providing news, research, statistical summaries, discussions, newsletters, online tools, online stores and a variety of other information and media for exchanging information for visitors. A portal may offer its services free to users and generate income from advertising and commissions charged to companies set up to offer products or services to customers for fees.

Reverse Auction: In a reverse auction, a buyer posts a request for proposals (RFP) for products or services, and sellers post bids to indicate what they would charge to provide those products or services. In a reverse auction, the bidders are the suppliers of the products or services, not the buyers. Another difference between a reverse and regular auction is that prices generally fall, instead of rise, as the auction proceeds. Therefore, lower bids are more likely to win in a reverse auction.

Vortal: A vertical-industry portal that provides information and resources over the Internet for a specific industry.

Computers help wastes pros communicate and research
Management of World Wastes November, 1988 p. 36-38
ISSN: 0161-035X

Waste managers are using personal computers to access **waste**-related information from a variety of databases, according to M Michaels, president, People Technologies. PCs linked to information services via modems are used by **waste** managers to research products, find landfills and **sell recycled waste**, among other tasks. One information service available to **waste** managers is **RecycleNet**, developed for the Assn of New Jersey Recyclers by F McCamic. RecycleNet offers bulletin board and electronic mail services that let members of the **waste** management industry communicate, trade information, and share solutions for **waste** management problems. The Natl **Waste Exchange** Database is another **online** service for exchanging information. This service, offered by the **Northeast Industrial Waste Exchange**, lets users obtain **buying** and **selling** information on acids, solvents, inorganic **chemicals**, textiles, wood and metals. One valuable database for researchers is the DIALOG information service, which...

One person's waste . (managing waste through a waste exchange program) (Environmentally Speaking) (Column)

... waste.

Operating under the philosophy that "one person's waste is another person's treasure," **waste exchange** organizations are gaining in popularity across the country. These groups are helping industry find alternative uses for **waste** materials.

The **waste exchanges** act as information clearing-houses, directories, and marketing facilitators for industry's reusable materials. They promote the **exchange** of **waste** by-products, surplus, off-spec, overstock, or damaged materials that no longer meet manufacturing needs.

Hazardous and nonhazardous, as well as unwanted materials, are included in the **waste exchange** inventories. Solvents, strippers, paints, and primers are just a few of the materials available. Sometimes...

...treatment or disposal expense. There is no charge for these services." She explains that other **waste exchange** groups operate similarly. Listings are also marketed through the National Materials Exchange Network, an on...

...profit exchanges charge for some services.

Companies that generate wastes should consider participating in a **waste exchange** program. Obviously, not all **wastes** can be reused. But if wastes are marketable, waste generators can greatly benefit in several ...

...storage costs, reduced disposal fees, reduced liability and transportation costs, reduced reporting and manifesting, and **raw - material acquisition** at lower prices. Participation also helps the environment by saving on landfill space. Participating companies...

As **buyers** seek ways to reduce **waste disposal** costs, the Environmental Protection Agency's (EPA) proposed nationwide **waste exchange** database is one alternative worth investigating.

"The **waste exchange** can be an environmentally sound recycling technique," says Myles Morse, director of the EPA's...

...How it works

In the U.S. and Canada there are about 20 non-profit **waste exchange** businesses in operation. Two years ago, members of these companies approached the EPA about how...

...we were implementing our pollution prevention initiative, and as part of that initiative we supported **waste exchange**," says Morse.

To be known as the Network of North American **Waste Exchange** Listings, companies would have to go through **waste exchange** firms to list a material. Materials are to be listed by availability, type, geographic area and date. To **purchase** materials, one would contact the **waste exchange** company associated with the listing.

One component of the network is an electronic bulletin board...

...of additional source reduction and recycling information.

Purchasing possibilities

Lewis Cutler, president of Northeast Industrial **Waste Exchange** Inc., a non-profit organization in Syracuse, N.Y., says because the EPA reaches a wide audience, the network will be beneficial for the **waste exchange** business. But, he says, any company, particularly chemical companies, can save money while being environmentally...

...plant managers to look at the possibilities here."

Filling a need

One of the problems **waste exchange** businesses have had in the past is the way information has been distributed. Historically, the...

...He says the EPA's database will ensure that information is current and allow the **waste exchanges** to become more effective. It's important to note, says Curlin, "That the EPA is not running a **waste exchange**; it is echoing listings that are sent by industry to **waste exchanges**."

Indeed, the EPA encourages industry to use **waste exchanges** as part of its pollution prevention program. The idea is a good one, and deserves...

Virtual waste: The Internet has become the happy home for one Clare-based company

GEOFF PERCIVAL
BUSINESS AND FINANCE
May 27, 1999

JOURNAL CODE: FBFN LANGUAGE: English RECORD TYPE: FULLTEXT
WORD COUNT: 716

Buying and selling industrial waste on the Internet may not sound like a viable e-commerce model but for one Irish-based company and its owner, it has worked out very well.

A virtual company in the true sense of the meaning, Wastechange was set up in Clare over a year ago, although it is 100% Internet located. Essentially it acts as an on-line matchmaker for Irish-based companies wishing to trade waste and by-products that would otherwise be destined for landfill. Members, who are charged an annual fee of IR pounds 48 per company, can phone, fax or e-mail Wastechange with details of their waste materials. These are then listed on Wastechange's website (www.wastechange.com) under the relevant categories. These include anything from batteries, metals and glass to food, rubber, plastics and wood.

'It's a very cost effective service. A waste producer can effectively solve its waste disposal problems for as little as IR pounds 48. In the non-virtual world, if you like, finding a match can cost them many thousands of pounds in consultancy fees, staff time or whatever. Any additional costs are down to the company but overall they'd be spending less than the landfill alternative,' according to managing director Sarah Howcroft.

'It's not just a service for companies looking for an alternative to dumping their waste. Those already providing to a reprocessor for recycling can use it as a cost comparison vehicle between their current recycling partners and potential new ones. It's a competitive industry in many ways. There's also a huge environmental gain. It's often a case of dual motivation. On the one hand there are definite cost savings while on the other there is environmental compliance, as many companies come under the waste management act,' she adds.

No volume quotas exist and there is no limit on the product types that can be listed. 'We will advertise it if its bona fide, legal and a waste with a market, which nearly everything has. There's nothing going into landfills that eventually can't be sorted,' says Howcroft. 'If we can demonstrate that there are large amounts of waste available in particular categories then maybe we can encourage the setting up of more recycling facilities and open up entrepreneurial avenues for people who can use our site as a map to show where the main demand in the country is located.

'There's a demand for waste and an increasing sense of responsibility among Irish waste producers, but it's hampered by communication problems. There are metal and chemical reprocessors in need of product, but it's a case of locating them. At the moment there are big holes in the Irish reprocessor market,' she says. Most of her clientele comes from the electronics and chemicals industries, even though she won't mention any of them by name on account of some of them being sensitive to people knowing of their waste arrangements. Though indigenous Irish customers are growing, the bulk tend to be foreign multinationals which are based in Ireland.

Getting support for the venture was not easy. The likes of Repack, Enterprise Ireland and IBEC have lent support, but initial funding was thin on the ground.

'Everything has been self funded. The government's funding arms either have no financing available until 2000 or feel the project is too premature. I think we've proved the idea works and I'm hopeful the government will soon take notice,' she adds.

Currently Wastechange is the only such service in Ireland. However, similar models are already proven in Germany and the US where the Internet

is more advanced and like-minded projects tend to be State owned.

Working as a one person enterprise backed up by her Psion organiser, mobile phone and website, Howcroft seems to have set up the perfect virtual company.

'It's very easy to get wound up in us being an Internet company. While we are using the Internet as a shop window and a tool for collating knowledge, the skill is in sorting out waste problems. It will, in the future, have major benefits for us as it allows us to trade globally. Right now it means we can communicate more easily. Every country has its own expertise in recycling and we can more readily tap into that and learn how Ireland and the company can work more effectively,' says Howcroft.
